3. INTEGRATED TOOLS: (Industrial training and Field visits)

Date: 15/09/2020

TO WHOM SO EVER IT MAY CONCERN

This is to certify that Mr./Ms. AEDMA SOUMYA is a bonafide student of SAMSKRUTI COLLEGE OF PHARMACY, and He / She has undergone industrial training in our organization from 15/08/2020 to 15/09/2020 as part of partial fulfillment of his / her B. Pharmacy course bearing Hall Ticket No.: 18Y71R0001.

During the training period, he/she had interacted with quality control, quality assurance & production departments and acquired basic knowledge in these areas.

During the aforesaid period, we found him / her hard working, sincere and learning attitude.

We Wish them a Bright Future.

Q. Answer the following questions:

1. Write about the properties of alpha, gamma and beta radiations?

Ans: Alpha particles, beta particles and gamma rays all originate from the nucleus of a radioisotope. A particle property of ionising radiations is its ability to ionise atoms. That is, this type of radiation can cause an electrically neutral atom to lose an electron, the atom becomes charged, and we call it an ion. In the cells of living animals, ionising radiation can create ions that are chemically reactive, which can lead to the damage or destruction of cells. Short term harmful effects are called somatic effects and long term hereditary effects are called genetic.

Alpha particles:-

Alpha particles radiation consists of two neutrons and two protons, i.e. they are charged they are affected by both electric and magnetic fields. The speed of

Cell: 9701368996

The α -particle depends very much on the source, but typically are about 10% of the speed of light.

The capacity of the α -particle to penetrate materials is not very great; it usually penetrates no more than a few centimetres in air and is absorbed by a relatively small thickness of paper or human skin. However, because of their speed and size, they are capable of ionising a large number of atoms over a very short range of penetration. This makes them relatively harmless for most sources that are about a metre or more away, as the radiation is extremely dangerous.

Beta particles:

Beta particle radiation consists of fast moving electrons. Every β -particle carries either one negative or one positive electron charge ($\pm 1.6 \times 10^{-19}$ Coulomb etc). They are affected by electric and magnetic fields. The speed depends on the source, but it can be up to 90% of the speed of light.

β particles can penetrate up to 1m of air. They are stopped by a few millimetres of aluminium or paper. Their ionising capacity is much less than that of α -radiation. They are very dangerous if ingested.

Gamma rays:-

Gamma radiation does not consist of charged particles, it is a form of very short wavelength electromagnetic energy. They travel at the speed of light (3×10^8 m/s).

Gamma radiation is very difficult to stop, it takes up to 30mm of lead. Although the ionising capacity of γ radiation is considerably smaller than that of α radiation, their high penetration power means that they are dangerous even at a distance. They can penetrate our bodies and hit sensitive organs. They are particularly dangerous if ingested or inhaled.
